Shreyas Shejwal

Gameplay Systems Programmer and Technical Designer

Pune, Maharashtra, India | [8208085301] | [shreyaspersonal2k06@gmail.com] | linkedin.com/in/shreyas-shejwal-751402333 | github.com/Buddy2k06 | [Portfolio URL]

Summary

Game development student seeking an internship or junior role as a gameplay programmer or technical designer. I build gameplay systems in Unity (C#) and C++ and design the mechanics and levels they support. Experience across local multiplayer, VR, puzzle and mobile games, including a game jam runner-up.

Skills

- **Engines:** Unity, Unreal Engine (working knowledge)
- **Languages:** C#, C++
- **Gameplay Systems:** Player controllers, Rigidbody physics, Object Pooling, Observer Pattern, State Machines, Behaviour Tress
- **Game Design:** Level design, paper prototyping, puzzle design, risk and reward systems, scoring balance, game design documents
- **Game Feel:** Screen shake, audio feedback
- **Visuals:** Basic shaders, outline styling
- **Tools:** Git, GitHub

Projects

PieWars! | Solo Programmer and Designer

Unity, C# | Local couch multiplayer party game (1v1 and 2v2) | In progress

- Building a controller-based arena game with stomp, melee and directional pie-throwing combat, team and target detection, scoring and respawn.
- Implemented movement and action locks using enum flags and bitwise operators to control which actions are disabled during states such as throwing and stun.

- Developed the multiplayer UI for local players.
- Wrote the game design document covering mechanics, systems, scope and a phased development schedule.

Plateformer | Game Designer and Technical Designer

Unity, C# | 24-hour game jam, team of 4 | Runner-up

- Created the concept for the jam theme "Unstable World": a platformer whose world switches between 2D and 3D on a timer.
- Designed and prototyped a depth-flattening technique: the camera switches to orthographic, every level object is moved onto one shared Z plane, and each object's original Z is restored when returning to 3D. This let one level serve both dimensions within a 24-hour scope.
- Designed levels on paper so that every 2D state can be escaped in 3D and the reverse, balanced around the switch timer.
- Handed the prototype to the team programmer for implementation in a team of 4, working with a UI programmer and an artist.

FairShots | Solo Game Designer and Programmer

Unity, C# | Mobile game prototype | Built in about 24 hours

- Designed and built a complete casual mobile game, in which the player shoots flying objects, to meet a replayability brief.
- Implemented rarity-based scoring (10, 15 and 30 points), a bomb hazard that ends the run, a five-heart life system and a saved best score.
- Built endless difficulty scaling by increasing the number of simultaneous objects and the bomb frequency over time.
- Added graded screen shake by event severity (hit, missed object, bomb) and audio feedback to improve game feel.
- Created a consistent visual style with outlines and a basic shader after free themed assets were unavailable.

Act of Chess | Solo Game Designer and Programmer

Unity, C# | Puzzle game

- Designed and built a chess-based puzzle game in which the player moves as a knight, using its L-shaped movement pattern to reach a chest and advance to the next level.

- Created a clean, readable visual style.

VR Pirate Ship | Solo Developer

Unity | Virtual reality

- Built a VR interaction in which the player picks up cannonballs from a ship deck, loads them into a cannon and fires it.

Education

Bachelor of Computer Applications (BCA), Game Development

Ajeenkya DY Patil University, Pune | 2027
